Objective

EC2 (Elastic Compute Cloud) is a core service provided by Amazon Web Services (AWS) that enables users to rent virtual servers in the cloud to run applications, store data, or handle computational workloads.

An EC2 Windows instance is a virtual machine running the Microsoft Windows operating system on Amazon Web Services (AWS) EC2 (Elastic Compute Cloud). This allows you to run Windows-based applications, manage Windows Server configurations, and use various Microsoft software (like SQL Server, IIS, etc.) in the cloud without having to manage physical hardware.

Use Cases for EC2 Windows Instances:

- **Web and Application Hosting:** Run IIS web servers or other Windows-based web applications in the cloud.
- **Database Servers:** Host SQL Server databases with EC2 Windows instances, using RDS or EC2 for more control.
- **Remote Desktop Applications:** Set up RDS (Remote Desktop Services) for remote access to Windows desktops in the cloud.
- **Development and Testing:** Create development environments with Windows OS to test .NET or other Windows-based applications.

Used Services in AWS:

Topology

Execution Tasks:

LAUNCH OF INSTANCE

The screenshot shows the AWS Management Console for the us-east-1 region. The breadcrumb navigation indicates the path: EC2 > Instances > Launch an instance. A green success banner at the top states: "Success Successfully initiated launch of instance (i-0b351f66af75d71d3)". Below this is a "Launch log" section. The "Next Steps" section includes a search bar and four recommended actions: "Create billing usage alerts", "Connect to your instance", "Connect an RDS database", and "Create EBS snapshot policy". Each action has a brief description and a link to perform the task. The footer includes links for CloudShell, Feedback, and Console Mobile App, along with copyright information for Amazon Web Services, Inc. or its affiliates.

This screenshot shows the AWS Management Console with the "Instances" page selected. A "Remote Desktop Connection" window is open in the foreground, displaying the computer name "34.229.118.246" and a "Connect" button. In the background, the "Instances (1/1)" table shows one instance: "WINDOW-K" with ID "i-0b351f66af75d71d3", state "Running", and type "t3.micro". The "Status check" is "Initializing". Below the table, the "Instance summary" for "i-0b351f66af75d71d3 (WINDOW-K)" is displayed, showing the Instance ID, IPv6 address, and Public DNS. A tooltip for "Public IPv4 address" shows "34.229.118.246" with a link to "open address". The footer is consistent with the previous screenshot.
